## 1 — PHY 494: Makeup assignment 1 (15 points total)

Due Thursday, April 22, 2021, 11:59pm.

This is a **optional Makeup Assignment**. If you choose to hand it in by the deadline, it will be graded like a normal homework assignment. If its grade is better than your worst homework grade then it will replace that grade.

Submission is to your private GitHub repository.

## 1.1 ODE with Scipy (15 points)

In this problem you should learn how to use existing functions in a library, namely in the scipy package (in particular, scipy.integrate). Part of the problem is to find and read the documentation for the function and figure out how to use it.

Use the Scipy function scipy.integrate.solve\_ivp() to solve the following ordinary differential equation

$$-\frac{1}{2}\frac{d^2\psi_n(x)}{dx^2} + \left[\frac{1}{2}x^2 - E_n\right]\psi_n(x) = 0$$
 (1)

$$\psi_n(0) = 1; \quad \frac{d\psi_n(0)}{dx} = 0 \tag{2}$$

$$E_n = n + \frac{1}{2}, \quad n = 0, 2, 4, 6, \dots$$
 (3)

for the real function  $\psi_n(x)^1$  and the three values n = 0, n = 2, and n = 8. The code should contain the following functions:

1. ode\_qmhosc() solves the ODE Eq. 1:

$$psi = ode\_qmhosc(x, psi0, dpsidx0, n=n)$$

that takes as arguments

<sup>&</sup>lt;sup>1</sup>If you have done Quantum Mechanics 1 (PHY 314) then you should recognize it as the Schrödinger equation for the simple harmonic oscillator.

- all the values x at which the solution should be evaluated (the first value must be the one for which the initial conditions are given, i.e., x = 0 for this problem),
- as initial conditions the function value and first derivative at x = 0 (Eq. 2), and
- the value of n that determines  $E_n$  (Eq. 3).

It should return the function values  $\psi_n(x)$  and the derivatives  $\psi_n'(x)$  as a numpy array of shape (2, len(x)) (which is what the "y" key in the return result of solve\_ivp() gives you).

2. **f\_qmhosc()** is needed to transform the ODE Eq. 1 into standard form so that it can be solved with scipy.integrate.solve\_ivp().

should produce the ODE standard  $form^2$  of the derivative vector  $\mathbf{f}$  when provided with

- the current values of **y**
- $\bullet$  the current value of t
- and the parameter  $E_n$  (see Eq. 1).

The starter code in makeup01.py has additional hints on how to create a function that is suitable for scipy.integrate.solve\_ivp().

- (a) Numerically solve Eq. 1 on a lattice with  $\Delta x = 0.01$  for  $0 \le x < 6$  for
  - n = 0
  - n = 2

$$\frac{d\mathbf{y}}{dt} = \mathbf{f}$$

and in the case of Eq. 1, we would have t = x,  $y_0 = \psi_n(x)$ , and  $y_1 = \psi'_n(x) \equiv \frac{d\psi_n}{dx}$ .

<sup>&</sup>lt;sup>2</sup>Remember that the ODE standard form is

Use the rk45 solver (find out how to select it for the solve\_ivp() function) and increase the default tolerance parameters for the solver to rtol=1e-8, atol=1e-8.

- (i) Write code that implements all the listed requirements. [12 points]
- (ii) Plot all your solutions in one figure and include the figure as a PNG named qmhosc.png. [3 points]
- (b) BONUS: Correct physical<sup>3</sup> solutions for Eq. 1 are symmetric  $(\psi(x) = \psi(-x))$  for even n and antisymmetric  $(\psi(x) = -\psi(-x))$  for odd n. This implies that the initial conditions for  $n = 1, 3, 5, \ldots$  are different from the ones for even n (Eq. 2). Choose appropriate initial conditions<sup>4</sup> and write a function

```
phi0, dphidx0 = initial_values_qmhosc(n)
```

that produces the correct initial values depending on the value of n. Using your initial values, solve Eq. 1 for n = 3 and plot the solution (include a PNG named qmhosc\_odd.png). [bonus +4\*]

<sup>&</sup>lt;sup>3</sup>Physical solutions for the wavefunction  $\psi_n(x)$  have to be normalizable, i.e., they have to decay to zero for  $x \to \pm \infty$ . The numerical solutions only fulfill this requirement for small x and even for moderately large x they start to diverge. It would be better to use specialized algorithms that have the normalizability requirement built in.

<sup>&</sup>lt;sup>4</sup>Choose  $\psi(0) \ge 0$ ,  $\frac{d\psi(0)}{dx} \ge 0$  and either use values of 0 or 1 because this is the convention employed in the tests.
